Project Testing Phase

Date	28-10-2026
Team ID	SWTID-2026-7875
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Testing Phase Overview

The primary objective of the Project Testing Phase is to rigorously validate the security rules configured in the ServiceNow instance. Specifically, testing ensures that script-controlled Access Control Lists (ACLs) correctly restrict record-level operations (Read, Create, Write, Delete) based on user roles and record field values (Branch = EEE).

2. Test Scope & Setup

Testing was executed by impersonating different user personas within the instance to evaluate access decisions across the u_institution_details table. The personas and targeted security configurations include:

- Target Table: u_institution_details (Institution Details)
- Test User Profile: EEE User (eeeuser@gmail.com)
- Assigned Security Roles: bb1 (Read), bb2 (Create), bb3 (Write), bb4 (Delete)
- Superuser Persona: System Administrator (admin) with elevated security privileges
- Data Condition Criteria: Branch field set to EEE vs non-EEE (ECE, CSE)

3. Test Cases & Execution Matrix

Test ID	Test Scenario	Active Persona & Roles	Target Record / Operation	Expected Behavior	Status
TC-01	Read ACL Verification (Authorized Branch)	EEE User (bb1)	u_institution_details list view	Displays EEE branch records only (INS0001007, INS0001004)	**PASS**
TC-02	Read ACL Verification (Unauthorized User)	User without bb1 role	u_institution_details list view	Access denied. Display message: 'No records to display'	**PASS**
TC-03	Admin Override Verification	System Administrator (admin)	u_institution_details list view	Full visibility across all records regardless of branch (ECE, EEE, CSE)	**PASS**
TC-04	Create ACL Verification	EEE User (bb1, bb2)	u_institution_details table	'New' button becomes visible and allows new record creation	**PASS**
TC-05	Write ACL Verification	EEE User (bb1, bb2, bb3)	u_institution_details record form	Fields on EEE records become editable and modifications can be saved	**PASS**
TC-06	Delete ACL Verification	EEE User (bb1, bb2, bb3, bb4)	u_institution_details list action menu	'Delete' option appears; selected record (INS0001007) is removed	**PASS**

4. Key Verification Findings & Summary

All test scenarios evaluated during this phase executed successfully in accordance with the project requirements:

- Script-Controlled Read Security: Verified that the script logic `if (gs.hasRole('bb1')) return true;` combined with the data condition `Branch is EEE` accurately restricts standard users from viewing non-EEE records.
- Role Granularity: Confirmed that each custom role (`bb1`, `bb2`, `bb3`, `bb4`) successfully controls its designated CRUD operation independently.
- System Admin Privileges: Confirmed that administrator override functions as designed, granting complete system access without being blocked by record-level ACL filters.
- Data Integrity & Interface Protection: Verified that unauthorized actions are blocked across forms, list views, and action dropdowns.
